

SCAILE Integration Assessment

Can Noodle / Lightfern Reach integrate with scale.tech?

Short answer

You cannot plug this project directly into scale.tech today. SCAILE does not expose a public integration API for their content engine, and their product is built for a different job than yours. What is feasible is a complementary partnership story, or enriching your app with SCAILE's open AEO tooling - not embedding Noodle inside their platform without their team.

What each product does

Dimension	Your project vs SCAILE
Job	Noodle: outbound find people/companies, research packets, Lightfern/Gmail draft. SCAILE: inbound AEO content, visibility tracking, social listening.
Flow	Noodle: Who should I reach? to match cards to handoff. SCAILE: How do we show up in ChatGPT/Perplexity? to articles and analytics.
Stack	Noodle: static frontend + Fastify backend (/api/brief, /api/run, /api/lightfern/handoff). SCAILE: managed content engine + marketing site + app.scale.tech dashboard.
API	Noodle: documented in backend/API-CONTRACT.md. SCAILE: no public SaaS API for the content pipeline.

SCAILE's grounding page explicitly states they are not a CRM, sales automation, or lead enrichment tool. Your app is exactly that - a research and outreach context layer.

This is not a natural drop-in integration. It is two different layers of GTM: SCAILE handles inbound AI visibility; Noodle handles outbound research and drafting.

Can you integrate into scale.tech?

Not without SCAILE's involvement.

Blockers

- No public integration surface - product is a managed 9-step content pipeline, not an embeddable developer platform.
- app.scale.tech is closed - the product UI lives behind their platform; you do not have access to that codebase from this repo.
- Product mismatch - SCAILE's dashboard is about content pipelines, mentions, and AEO scores, not find investors in London and draft outreach.
- Adding Noodle would mean a new product module, not a configuration toggle.

Where it could make sense (with SCAILE)

As an add-on for clients who want to activate outbound after content identifies gaps - for example: You are invisible for query X, here are 8 companies/people to pitch. That is a partnership conversation with SCAILE leadership, not something you can ship solo.

What you can do from this repo

Option A - Integrate SCAILE data into Noodle (most practical)

SCAILE open-sourced their AEO analysis stack: github.com/scailetech/openanalytics with endpoints POST /health (29-point site health), POST /mentions (AI visibility), and POST /analyze (full combined analysis).

- Run AEO score on the target's domain for company match cards.
- Surface gaps in suggested_angle - e.g. They rank F for AI visibility on logistics queries.
- Self-host openanalytics, or ask SCAILE for hosted API access. An aeo/ provider fits your existing backend provider pattern.

Option B - Wire the frontend to your existing backend

script.js is still a static demo. The backend is ready at localhost:8787 per API-CONTRACT.md, but nothing calls it yet. This is the first integration step regardless of SCAILE.

Option C - Partnership / narrative only

For a hackathon or pitch: SCAILE = inbound AI visibility; Noodle + Lightfern = outbound activation on researched targets. The story works; a live technical bridge does not exist today.

Option D - Light marketing cross-links (low effort)

Link target company domains to SCAILE's free checker (scaile.tech/#ai-score) or leaderboard.scaile.tech - useful context, not real integration.

Recommendation

Goal	Feasibility / Next step
Embed Noodle inside scaile.tech	Not without SCAILE. Email info@scaile.tech or book a strategy call.
Enrich Noodle cards with AEO scores	High feasibility. Self-host openanalytics or request API access.
Complete the Noodle demo end-to-end	High feasibility. Connect index.html to POST /api/brief and SSE /api/run.
Position as SCAILE inbound + Noodle outbound	Easy - positioning only.

Bottom line

Integrating this project into scaile.tech's webapp is not something you can do unilaterally - different products, no public API, closed platform. The realistic paths are: (1) enrich your app with SCAILE's open AEO tooling for smarter outreach angles, or (2) partner with SCAILE if you want Noodle inside their product.

Suggested next step in this repo: wire the frontend to your backend, then add openanalytics enrichment on company cards.
